                                                                                                                                                                                                                                                                                                                                                                                                                               /note="Vector: pBluescript SK(-); Site_1: EcoRI; Site_2: XhoI; supplier: UC Berkeley, PGEC; sequencing: The Institute for Genomic Research. Whole plants were challenged with 450,000 sporangia/ml P. infestans isolate US-1 (US940501) in Biotron (Madison, Wisconsin). Leaf tissue was collected at 1, 2, 5, 12, and 24 hours post-challenge and frozen in liquid nitrogen immediately upon removal. Kennebec plants showed no signs of HR.
                                                                                                                                                                                                                                                                                                           Katahdin plants (susceptible to P. infestans US-1) were used as controls and showed infection. NOTE: We cannot exclude the possibility that this sequence is actually derived from Phytophthora rather than potato. "

/note="Vector: pBlueScript SK(-); Site_l: EcoR1; Site_2:
Xhol; supplier: Giovannoni; Fruit were tagged at the
breaker stage (first sign of lycopene accumulation on the
blossom end of the fruit) and harvested 7 days
post-breaker (fully red-ripe), 10 days post breaker, and
20 days post-breaker (over-ripe). 20 day fruit which
showed external or internal signs of pathogenesis were
discarded. Fruit were cut in half and the seeds and
locules were discarded prior to freezing the pericarp."
